

Task Overview

Your task is to build a lightweight **Lead Distribution Portal** that consists of a simple client-facing web form, an internal tracking dashboard, and a server backend.

When a user submits the web form, your backend must ingest the data, update your local dashboard in real-time, and programmatically synchronize, validate, and route that lead into a **HubSpot Developer Sandbox Account** via HubSpot's CRM APIs.

Architecture & Technical Requirements

[Web Form Submission]

[Your Backend Server] —(Real-time Event)—> [Your Internal Dashboard]

(OAuth / Access Token)

[HubSpot CRM API]

1. Form & Ingestion Engine

Create a public-facing HTML form (or a single-page app) that collects the following prospective client details:

- First & Last Name
- Corporate Email Address
- Company Name
- Estimated Annual Budget (Dropdown options: Under \$10k, \$10k-\$50k, Greater than \$50k)

2. The Internal Dashboard

Build a single-page monitoring interface that displays:

- **Live Lead Feed:** A clean table displaying all submitted leads, showing their local database status and their corresponding HubSpot Sync status.
- **The Hubspot Router Control:** An interface or toggle section showing the status of your webhook integration connection to HubSpot.
- **Analytics Badges:** Real-time summary statistics showing total leads ingested and total estimated pipeline value processed.

The recruiter will add you to the Hubspot account for doing this integration
